
t
LinOSS branch
240 s windows every 120 s
blended with sin² weights
bidirectional: past and future
blue: windows that cover t
120 s stride
240 s window
1 s stacker (lr_ctx)
centred moving means of z_L
adds up to 30 s each side
S61(z_L): centred 61 s moving mean
S15(z_L): centred 15 s moving mean
CatBoost branch
60 s windows every 15 s
11 statistics per feature over
windows i−7 … i+7 (±105 s)
reach ≤ 165 s either side of t
the 4 windows that cover t (60 s each)
starts every 15 s: ±7 windows = ±105 s
i−7
i
i+7
−120 s
context span of window i: 270 s of signal
+150 s
p_C(t) reads signal at most 165 s either side of t
12 s clip
for comparison
TUSZ 12 s output: up to 240 s of LinOSS
and up to ±165 s of CatBoost context
12 s clip
CHB-MIT: both branches see only the clip
time relative to t (s)
